Title:

Shipping Final Project Proposal

Executive Summary:

 I want to create a project that helps shipping companies like Fedex and Ups keep track and organize orders and shipping. I think this is something that would help a lot of major companies become more efficient. I'll be using spring boot to create an application that allows the user to manage shipping and orders.

Initial Features:

Create a bulleted list of planned features you plan to have completed in your project by the deadline. This should include a list of API endpoints for each feature. If you are working in a group, please note which team member will be assigned to each feature.

Example of list of Features/Endpoints for a Library API:

- Entities: Users, Ship, Shipping , Companies, Orders , etc.
- A User can perform the following operations:
    - Login, and use system
    - Manage and keep track of orders
    - FInd the location of a shipped item
    - Create an order
    - Retrieve the info of an order
    - Ship an order

Stretch Goals (to be completed if time allows, or after graduation):

Final Project Proposal

Create a bulleted list of planned features you plan to have once you have completed your initial features. These should be features that may require more research in how to implement or features that would take longer than the allotted time frame.
